TITLE: Reaction delay between hearing and writing down of vowels

PERIODICAL: Akusticheskiy zhurnal, v. 8, no. 1, 1962, 26 - 33

TEXT: To analyze the reaction delay between hearing and writing down of vowels, two test persons wrote down 900 natural vowels each, and 1260 vowels each which were shortened by a relay to 15, 50, and 100 milliseconds, the process of writing being recorded by means of an oscilloscope. To be able to select the corresponding phoneme for each sound in fluent speech, the sounds must not follow each other faster than every 300 - 400 milliseconds; for fluent speech, this time equals 100 - 200 milliseconds. The authors calculated that the average time required for selecting a phonetic symbol was 55 milliseconds. They also ascertained that the reaction time for writing did not depend on the sound duration of the vowel. To determine a systematic correlation between the characteristic properties of a signal and the time required for its identification, histograms of the time required for identifying the individual vowels were studied. The statis-

TITLE: Significance of imitation for recognition of sound sequences

PERIODICAL: Referativnyy zhurnal. Matematika, no. 6, 1962, 85, abstract  
6V466 (Vopr. psikhologii, no. 5, 1961, 173-182)

TEXT: One of the stages in the process of recognition of speech by man was studied - the conversion of speech sounds into their articulated forms by imitating sound sequences when recognized. Three-letter sequences were formed by shuffling three vowel sounds (a, e, u) or three tone signals of different frequencies. The amount of information taken in by the subject was estimated by J. Miller and P. Nicely's method. It was experimentally proved that: (1) fast sequences of vowels are recognized considerably better than fast sequences of tones; (2) imitation of tone signals by vowel sounds leads to a considerable improvement in the recognition of these sequences of fast signals; (3) there is a clear relationship between the recognizability of fast sound sequences and the latent period of reaction to the individual elements of these

Card 1/2

Significance of imitation for ...

S/044/62/000/006/126/127

sequences; (4) distinguishing of the signals' order of sequence in time is determined not by the time parameters of the analysing system but by the time characteristics of the process of selecting a reaction corresponding to the input signal. These results allow certain suggestions to be made about a possible logical model of recognition.

TITLE: Automatic Compressed-Air Distribution Over a Group of Automatically-Controlled Oil Wells (Avtomlicheskoye raspredeleniye raskhoda shatogo vosdukha, podavayemogo v gruppu avtomatizirovannykh skvazhin)

PERIODICAL: Tr. Energ. in-ta AN AzerbSSR, 1956, Nr 13, pp 19-34

ABSTRACT: In lieu of today's manual distribution of compressed air over oil wells on a prescribed schedule, an automatic control has been developed and experimentally verified in which a common command device (OE-MG-410), a common switchgear, and individual actuating devices with limiters are added. Specifications on the automatic distribution system are presented. Methods of alignment, experimental data, and diagrams are given. There are 8 illustrations. Bibliography: 2 items.

TITLE: Electrochemical separation of small quantities of tellurium from selenium

SOURCE: Zhurnal prikladnoy khimii, v. 38, no. 3, 1965, 555-558

TOPIC TAGS: electrochemical separation, electrochemical purification, tellurium, selenium, electrolysis

ABSTRACT: Electrochemical technique was used for purification of commercial tellurium. The electrolyte composition was (per cent): NaCl--20, NaOH--2 to 5, Te(IV) + Se(IV)--0.2 to  $1 \cdot 10^{-3}$ . The electrolysis was done in a 500-700-ml beaker provided with platinum net electrodes, at a current density of 2 to 3 ma/cm<sup>2</sup>, and in a temperature range from 18 to 20°C. Under these conditions a crystalline elemental tellurium is deposited on the cathode while selenium remains in solution. Most of the tellurium deposition forms within the first hour of electrolysis.<sup>1</sup> During 12 to 15 hour electrolysis, the concentration of tellurium in the electrolyte drops from 0.15 to  $2 \cdot 10^{-5}$  per cent and then the fall-out of tellurium ceases.

Card 1/2

L 52307-65

ACCESSION NR: AP5008808

Polarographic, spectral, and quantitative analytical examination of the tellurium platings showed 0.5 to 6 per cent of elemental selenium as well as some Pb, Hg, Ni, and Cu. Subsequently sulfuric acid is added up to neutral pH of the electrolyte and the selenium is precipitated out at a current density of 0.07 to 0.15 a/cm<sup>2</sup>. The resulting selenium is free from Hg, Pb, and Ag contaminants which were present in the starting technical grade selenium sample. Attempts to use [PO<sub>4</sub>]<sup>3-</sup> ions and an asbestos membrane to separate tellurium from selenium resulted in reduction of tellurium concentration in the electrolyte not lower than 5·10<sup>-4</sup> per cent and 1·10<sup>-4</sup> per cent, respectively. Orig. art. has: 2 figures, 1 formula, and 3 tables.

TITLE: Polarographic determination of some impurities in pure selenium

SOURCE: Azerbaydzhan'skiy khimicheskiy zhurnal, no. 2, 1966, 117-121

TOPIC TAGS: polarographic analysis, tellurium, selenium, copper, lead

ABSTRACT: A method was developed for determining Te, Cu and Pb polarographically in pure selenium. It is based on recording polarographic waves of these impurities. When the latter are electrolytically reduced, the Se(IV) ions are polarographically inactive and in some cases their solutions serve as the polarographic background for the determination. The effect of pH of the medium, surface-active agents, temperature, etc. on the peak of the Te(IV) wave was determined. The peak is thought to be due to the catalytic liberation of hydrogen. Copper and lead were determined by amalgam polarography preceded by their concentration in the amalgam form on a stationary mercury drop. The relative error of the determination is  $\pm 5-10\%$  for Te,  $\pm 15\%$  for Cu, and  $\pm 15-18\%$  for Pb. Orig. art. has: 3 figures, 2 tables and 2 formulas.

TITLE: A new apparatus for determining the thermal stability of motor fuels

PERIODICAL: Referativnyy zhurnal. Khimiya, no. 3, 1961, 480, abstract 3M282.  
(Azerb. kimja zh., Azerb. khim. zh., 1959, no. 6, 27 - 32)

TEXT: The authors recommend a laboratory apparatus which operates under dynamic conditions to determine the thermal stability of fuel during heating of the test sample at 175°C for 30 minutes. The apparatus (a schematic diagram is given) consists of an electrically heated cylindrical body containing a disk rotating at 25 rpm and seated on a shaft connected to an electric motor. Four LCA (ISA) flasks filled with test samples are fitted to the disk; by the end of the test the oxygen in the flasks is practically completely consumed.

TITLE: Topping of natural gas under pressure

SOURCE: AN AzerbSSR. Doklady, v. 21, no. 9, 1965, 16-19

TOPIC TAGS: degassing, butane, gasoline, natural gas

ABSTRACT: Natural gas containing 11.5 g gasoline per m<sup>3</sup> was topped continuously by a countercurrent fluidized layer of activated carbon (0.5-1.5 mm) in a column at 5 atm. The gas was fed into the bottom of the column (250-320°C) at a rate of 25 m<sup>3</sup>/hr; gas flow in the column was 0.1 m/sec and carbon circulation was 100 kg/hr. At a carbon/gas ratio of 4.0 kg/m<sup>3</sup>, extraction of gasoline was 100% and that of butane was 90%. By raising the ratio to 6.0 kg/m<sup>3</sup>, butane extraction reached 100%. Enrichment of gas to a gasoline content of 45 gm/m<sup>3</sup> did not impair efficiency of extraction. Presented by M. G. Nagiyev, Academician of the AN Azerbaijan SSR. Orig. art. has: 4 tables.

Title : Spreading of Erosion of Soils in Azerbaijan.

Orig Pub: Pochvovedeniye, 1957, No 1, 62-68.

Abstract: About 40% of soils of Azerbaijanian SSR is affected by the processes of erosion. An approximate zoning of the territory of the Republic - in respect to soil erosion - is suggested. Chestnut, brown soils, mountain black earth and steppe-forest soils of the lowlands at the foot of the hills, are slightly affected by the washout. A medium washout, with an important increase of ravines, appears on large territories of the Bol'shoy

Abs Jour: Ref Zhur-Biol., No 8, 1958, 34442.

Abstract: Kavkazskiy Khrebet and Malyy Kavkaz, with various soils and with predominance of mountain meadows. Strong erosion is characteristic to watersheds of Big Caucasus with mountain-roadway soils. Wind and water erosion of soils, with strong erosion in ravines, embraces the Eastern and Southern slopes of Bol'soy Kavkaz with chestnut, brown and gray-brown soils. Strong plane erosion, with the presence of numerous flood waters which erode land on denuded hills, is observed in the Kuktashenskiy Rayon and in the South-Eastern part of Nakhichevanskaya ASSR. Wind erosion predominates in the North-Western part, on the steppe plateau and on the blanket of Apscheron Peninsula. -- S. A. Nikitin.

AUTHOR: Alekperov, K. A.; Kusov, A. B.; Lukashevich, I. P.; Socheyko, T. I.

TITLE: Resin mixture plasticizer made of extracts from selective purification of petroleum lubricating oils

SOURCE: Neftepererabotka i neftekhimiya, no. 8, 1965, 27-30

TOPIC TAGS: plasticizer, butadiene styrene rubber, synthetic rubber

ABSTRACT: Applicability of 340-400°, 400-450°, and 450-500°C fractions, of the prepurified distillate extract, their mixtures, and their blends with vacuum distillation residue (above 500°C) as plasticizer for resin mixtures based on non-plasticized SKS-30<sup>1</sup> butadiene-styrene rubber was studied. The individual fractions and the residue were obtained by vacuum distillation of phenol- and furfurol extracts from distillate. The distillate extract was a product of the NPZ plant at Omsk. The object of this study was to develop a substitute for the PN-6 residual extract (vacuum distillation residue--above 500°C), and to assure a compliance of the substitute with the VTU 71-61 technical standard for the PN-6<sup>1</sup> extract. The base non-plasticized resin was prepared by rolling the following mixture (in weight

Card 1/3

L 3904-66

ACCESSION NR: AP5023506

units): SKS-30 rubber--100, stearic acid--2.0, zinc oxide--5.0, channel gas black--50, Altax--0.6, diphenylquanidine--0.75, and sulfur--2.0. After rolling the mixture was vulcanized for 10-80 min at  $143 \pm 1^\circ\text{C}$ . It was found that mixtures of narrow fractions of distillate extract with distillation residue can be used as plasticizer substitute for butadiene-styrene rubber. The effect of plasticizer substitute viscosity on tensile strength of SKS-30 vulcanized rubber (content of the channel gas black is 50 wt %, content of the softener is 20 wt %) is shown in fig. 1 of the Enclosure. The strength of the vulcanized rubber increases with increasing content of heavy aromatics and tar in the plasticizer. Orig. art. has: 1 figure, 2 tables.

(Kafedra tekhnologii reziny, Leningradskiy tekhnologicheskiy institut)

TITLE: Use of petroleum refining waste as a raw material for the rubber industry

SOURCE: IVUZ. Khimiya i khimicheskaya tekhnologiya, v. 8, no. 4, 1965, 659-662

TOPIC TAGS: filler, rubber chemical, petroleum product

ABSTRACT: One of the wastes of petroleum refining is the so-called "plast", a by-product from the unit preparing the multifunctional additive "AzNII-4". The "plast" is a brown plastic mass containing valuable reagents: unreacted sulfur and calcium chloride, sulfo salts, and a large quantity (35 - 50%) of petroleum oils (motor oil "T"). The authors found that the "plast" can be used as a softener, filler, and vulcanization activator in filled rubber mixtures based on SKS-30 butadiene-styrene rubber. It also increases the resistance of vulcanizates to thermooxidative aging. With other rubbers, the "plast" can be used as a softener and extender. In addition to improving the physicomechanical characteristics of rubbers, it is very economical to use, since it amounts to 50% of the target product of the refinery, and has to be wasted
